

# CS 4530

## Fundamentals of Software Engineering

### Module 16: Refactoring and Technical Debt

---

Adeel Bhutta and Mitch Wand  
Khoury College of Computer Sciences

# Learning Goals

---

By the end of this lesson, you should be able to...

- Define *refactoring*, *technical debt*, and give examples.
- Explain how refactoring fits into agile process and help reduce technical debt
- Suggest when it may be appropriate to accrue technical debt and when it may be appropriate to retire it

# Refactoring

---

**Refactoring** is the process of applying transformations, *refactorings*, to a program and the *internal structure* of the system is improved

Goals:

- keep program readable, understandable, and maintainable
- by eliminating small problems soon, you can avoid big troubles later

Characteristics:

- **behavior-preserving**, i.e. do not change what the program does
- **incremental**, i.e. proceeds in small steps with tests at each stage

# Example

---

## Original Code

```
function greeter (firstName : String, lastName : String) {  
    return "Hello, " + firstName + " " + lastName;  
}  
document.body.innerHTML = greeter("Jane","Doe");
```

### Refactored Code # 1

```
function greeter (firstName : String, lastName : String, greeting = "Hello, ") {  
    return greeting + firstName + " " + lastName;  
}  
document.body.innerHTML = greeter("Jane","Doe");
```

### Refactored Code # 2

```
function greeter (firstName : String, lastName : String, greeting : String) {  
    return greeting + firstName + " " + lastName;  
}  
document.body.innerHTML = greeter("Jane","Doe","Hello, ");
```

# Dad

---

Martin Fowler is the “father” of refactoring

“Any fool can write code that a computer can understand

Good programmers write code that humans can understand”

# The Book

---

A catalogue of refactorings, similar to the design patterns in the GoF book

- Names each transformation
- Helpful for team communication
- Names “bad smells” (triggers for refactorings)
- Discusses when and how to apply refactorings

Many refactorings are the inverse of another refactoring

- often there is not a unique “best” solution
- discussion of the tradeoffs

# The List

---

Fowler gave colorful names to his “code smells”

[Mysterious Name](#)

[Duplicated Code](#)

[Long Function](#)

[Long Parameter List](#)

[Global Data](#)

[Mutable Data](#)

[Divergent Change](#)

[Shotgun Surgery](#)

[Feature Envy](#)

[Data Clumps](#)

[Primitive Obsession](#)

[Repeated Switches](#)

[Loops](#)

[Lazy Element](#)

[Speculative Generality](#)

[Temporary Field](#)

[Message Chains](#)

[Middle Man](#)

[Insider Trading](#)

[Large Class](#)

[Alternative Classes with Different Interfaces](#)

[Data Class](#)

[Refused Bequest](#)

# Renaming

---

Is the most common...

- Rename Function (124)
- Rename Variable (137)
- Rename Field (244)

We are often afraid to rename things, thinking it's not worth the trouble, but a good name can save hours of future puzzled incomprehension

Renaming is not just an exercise

When you are not happy with a name, it's often a sign of a deeper design malaise.

Puzzling over a tricky name leads to significant improvements to your code

Remember:  
Use Good Names!

# Renaming

Luckily, VSC automates this and many other common transformations

```
}

const [tick, setTick] = useState<boolean>(false);
function forceRedisplay() {setTick(!tick)}
    (local function) handleTick(): void
function handleTick() {
    props.handleTick
    // th Enter to Rename, Shift+Enter to Preview toplevel, :
    forceRedisplay();
}

// const [nDeleted, setnDeleted] = useState<num
const [lastDeleted, setLastDeleted] = useState<
```

# Local Refactorings

<https://refactoring.guru/>

<b>Rename</b>	provides better intuition for renamed thing's purpose
<b>Extract Method</b>	enables reuse; avoids cut-and-paste; improves readability
<b>Inline Method</b>	replace a method call with method's body; often intermediate step
<b>Extract Local</b>	introduce a new local variable for an expression
<b>Inline Local</b>	replace a local variable with the expression that defines its value
<b>Change Method Signature</b>	reorder a method's parameters
<b>Encapsulate Field</b>	introduce getter/setter methods
<b>Convert Local Variable to Field</b>	sometimes useful to enable application of Extract Method

# Type-Related Refactorings

aka ***Refactoring by Abstraction***

Bad abstraction is worst than duplication

- (pieces of code that look the same, still represent different concepts).

Use “**Rule of Three**” – Three strikes and you refactor

<https://understandlegacycode.com/blog/refactoring-rule-of-three/>

<b>Generalize Declared Type</b>	replace type of a declaration with more general type
<b>Extract Interface</b>	create new interface, and update code to use it where possible
<b>Pull Up Members</b>	move methods and fields to a superclass
<b>Infer Generic Type Arguments</b>	infer type arguments for “raw” uses of generic types

# Why Refactor?

---

New or anticipated requirements **require a different design**

Altered design will make **testing easier**

Altered design will **improve maintainability**

**Fix sloppiness** by programmers

Retire or avoid technical debt

# When to refactor?

---

Refactoring is incremental redesign

Acknowledge that it is *difficult to get design right the first time*

When?

- adding new functionality,
- fixing a bug,
- doing code review, or
- any time

A key part of TDD!

Refactoring evolves design in increments

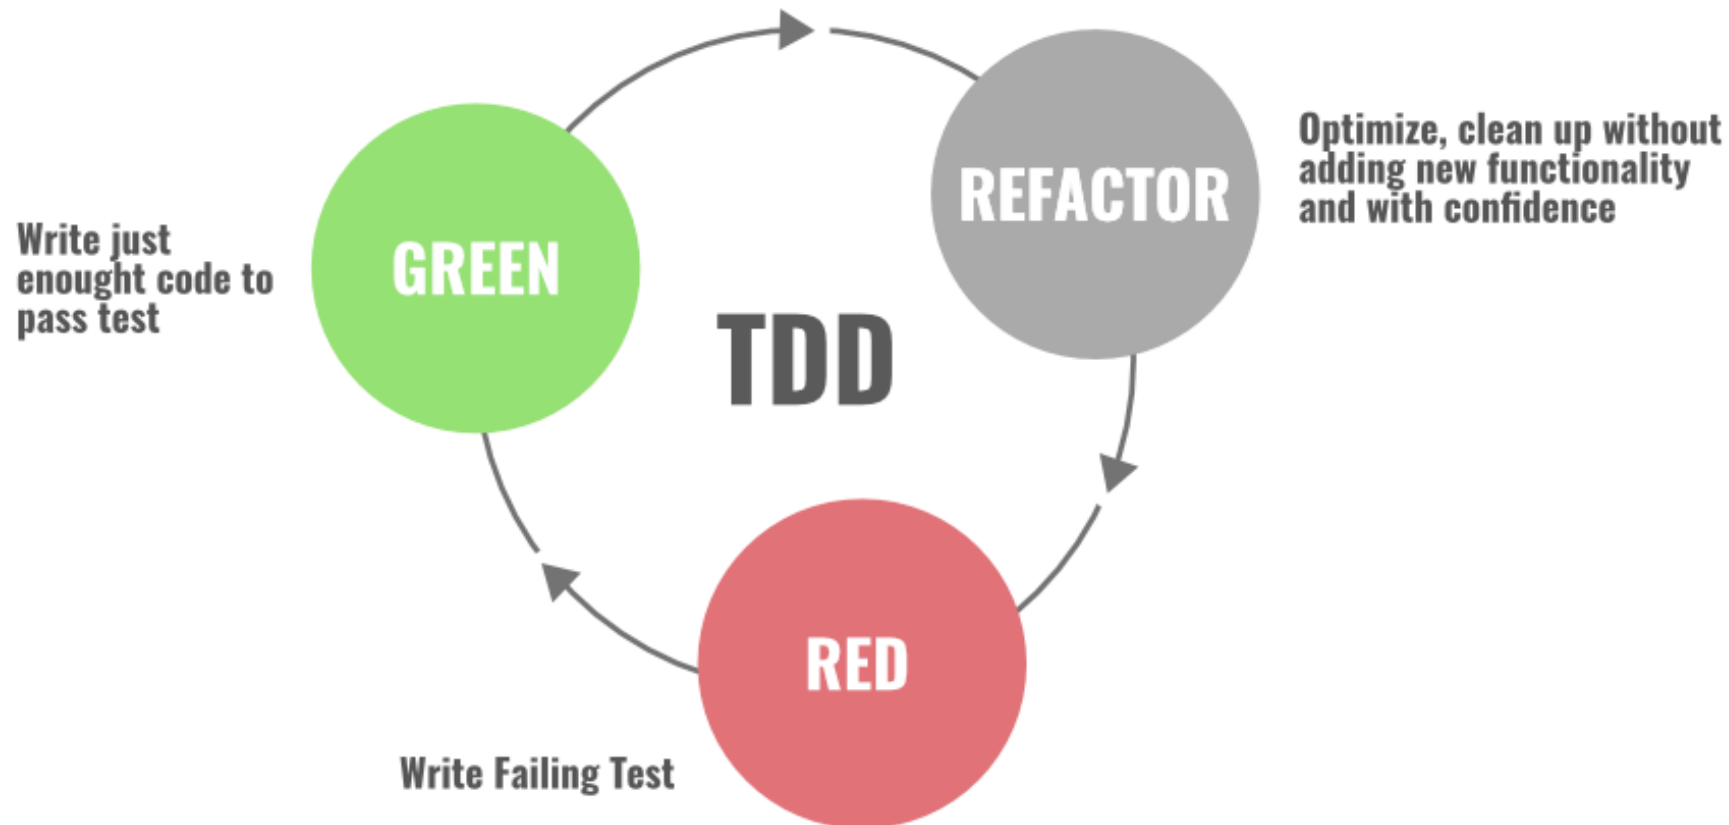

Refactoring reduces technical debt

# Refactoring with TDD

**Red:** start writing failing “red-test”. Stop and check what needs to be written

**Green:** next, write simplest code that gets tests to “green”

**Refactor:** finally, focus on improving & enhancing code while keeping test green

# Refactoring Benefits

---

Small incremental steps that preserve program behavior

- ...simplify regression testing

Aiming for simple steps

- ...allows for automation

Refactoring needs not proceed in a straight line

- ...sometimes, you want to undo a step you did earlier
- ...when you have insights for a better design
- Having a name for what you did makes undos easier

# Refactoring Risks

---

Developer time is valuable: is this the best use of your time today?

Despite best intentions, may not be safe

Potential for version control conflicts

It brings us to Technical Debt

# Technical Debt

---

... is the accumulation of internal problems in a code base

*Internal because they don't show as user-visible failures*

Examples:

- Code Smells
- Missing tests
- Missing documentation
- Dependency on old versions of third-party systems
- Inefficient algorithms

**Not just code!**

# Technical debt

---

...has costs, i.e. **interest on the debt**

## **Examples of Debt**

Code Smells

Missing tests

Missing documentation

Dependency on versions of third-party

Inefficient/non-scalable algorithms

## **Examples of Cost**

“Smelly” code is less flexible

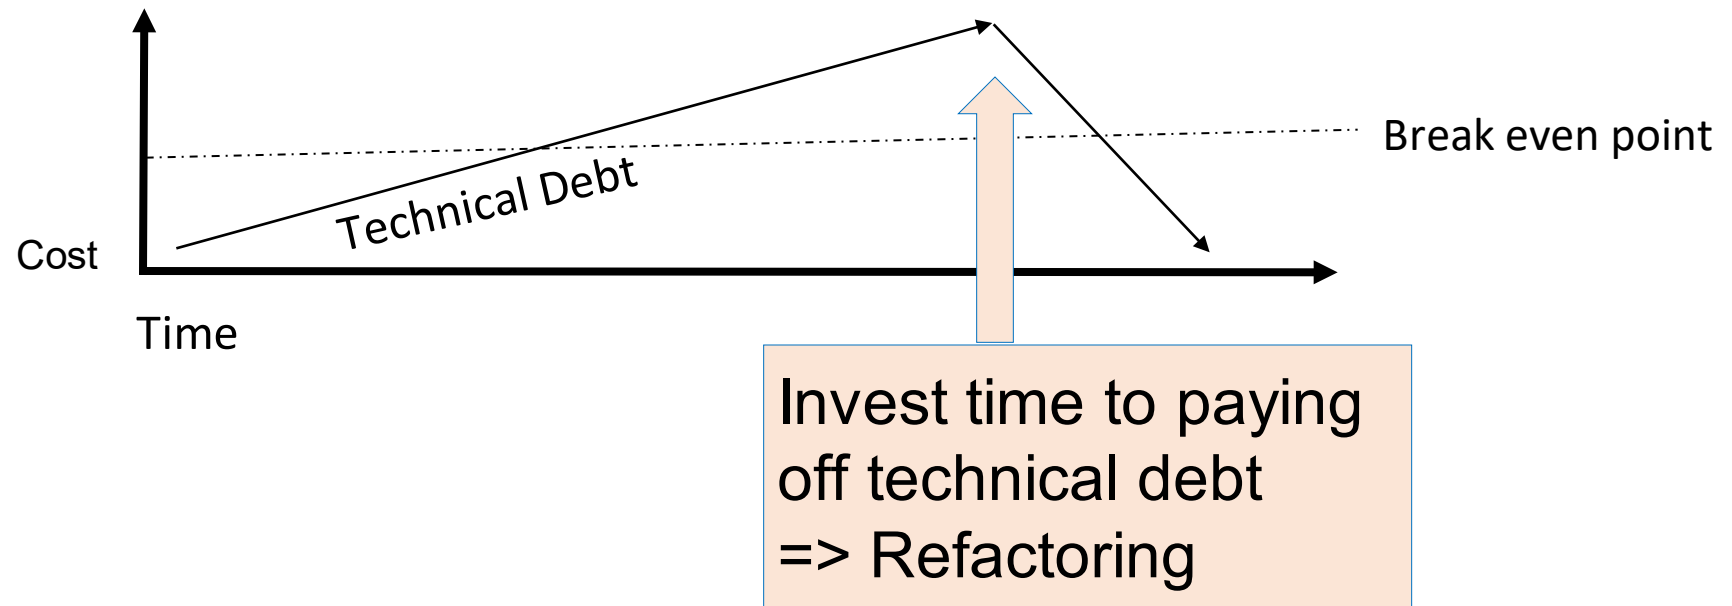

need to revert breaking change

can't figure out how to use

may have to take over maintenance  
of old system

lose potential customers

# Interest accrues over time

# Make Technical Debt Visible

Here are the steps:

- Plan the ideal
- Track your actual
- Track what you spend on waste
- Put it all together

## MAKE WASTE VISIBLE

Help stakeholders visualize data (like progress, effect of debt, refactoring)

# Reasons to go into Debt

---

## Prototyping

- If code will be discarded, or rewritten, don't waste time perfecting it

## Getting a product out the door

- Time is often crucial in a competitive environment

## Fixing a critical failure

- People are waiting

## Maybe a simple algorithm is good enough

- “Premature optimization is the root of all evil” — Tony Hoare, Donald Knuth

# Architectural debt is costliest

---

Total cost of ownership generally higher than implementation-level issues; harder to get out of choices of:

- Language
- Middleware frameworks
- Deployment pipeline

Consider:

- What are the quality attributes that our software needs to ultimately satisfy?
- How do these architectural decisions reflect those attributes?

# Y2K bug as example of architectural debt

How many digits does it take to store a year?

**\$24,847 in 2023 USD**

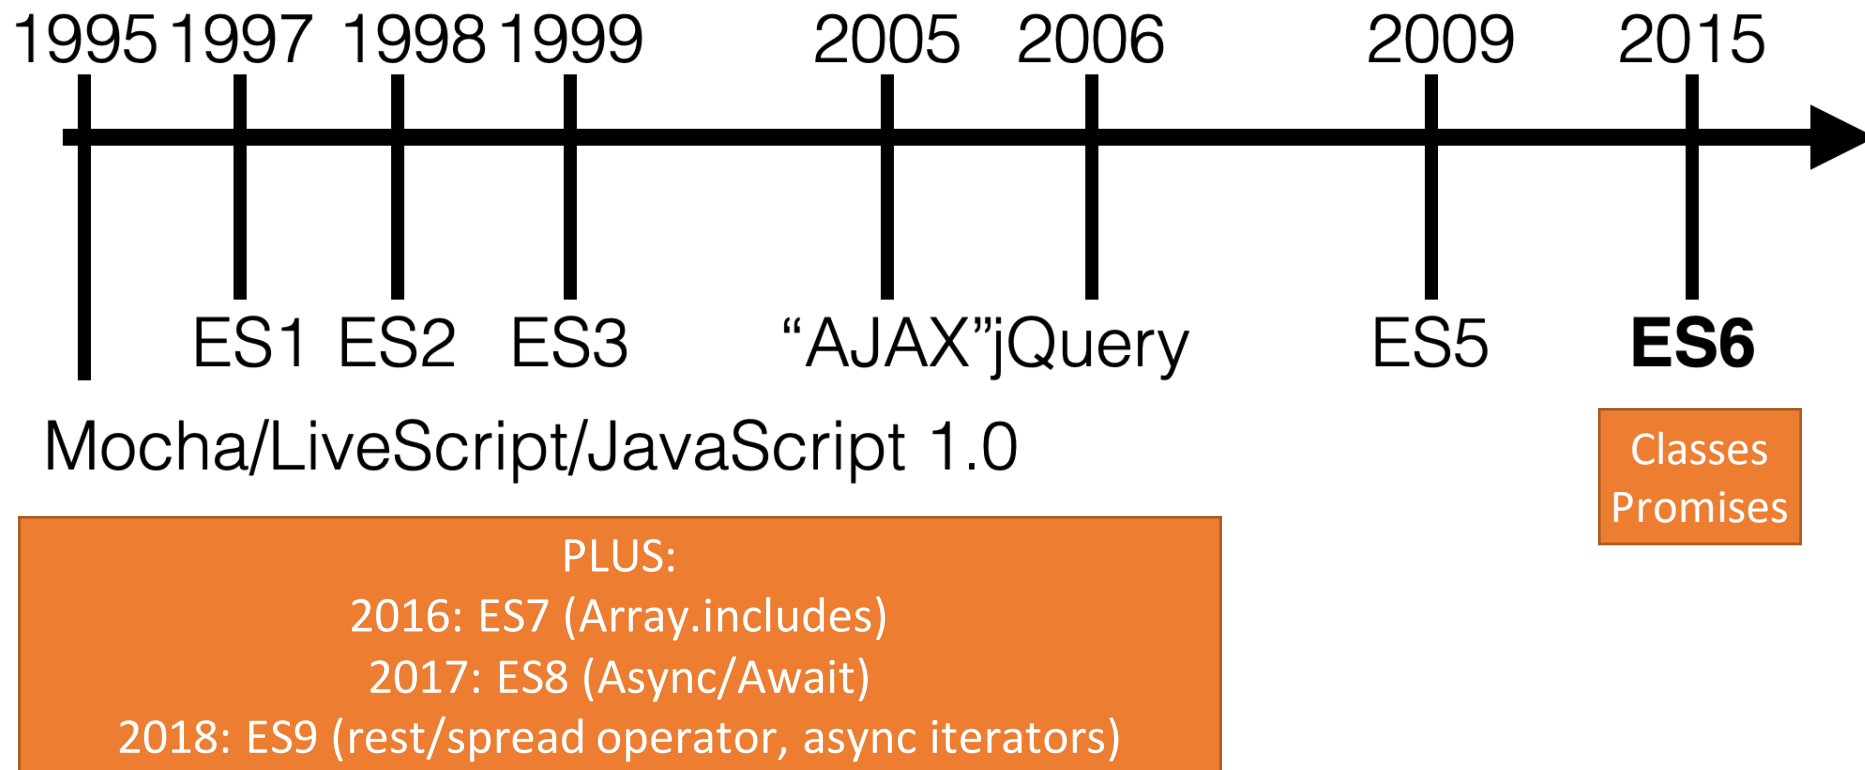

“I just never imagined anyone would be using these systems 10 years later, let alone 20.”

# Evolving languages make debt

Choice of language can cause technical debt, particularly if that language is rapidly evolving.  
Consider JavaScript

# Facebook's debt

---

04-07-14

## Why Facebook Invented A New PHP-Derived Language Called “Hack”

Instead of throwing out years of legacy code, Facebook built a new branch of the language that originally underpinned TheFacebook.com. Here's the story behind a two-year labor of love.

[IMAGE: FLICKR USER BULL3T HUGHES]

# Facebook's debt

---

Hack added new safety features...

- ...automatic type inference
- ...lets you specify types of variables
- ...issues an error if code is logically inconsistent
- When a file changed, two versions had to be compared to deduce what must be rechecked at a very fine-grained level
- *“Hack enables us to dynamically convert our code one file at a time”* - Facebook Technical Lead HipHop VM (HHVM)

# Instagram's debt

## SCALING PYTHON TO SUPPORT USER AND FEATURE GROWTH

# Instagram's debt

## From Python 2 to 3

- Migrated in 10 months
- All work done directly in Master branch
- Upgraded all packages (Working Rule: not in Py3 => not used)

## Examples of refactorings:

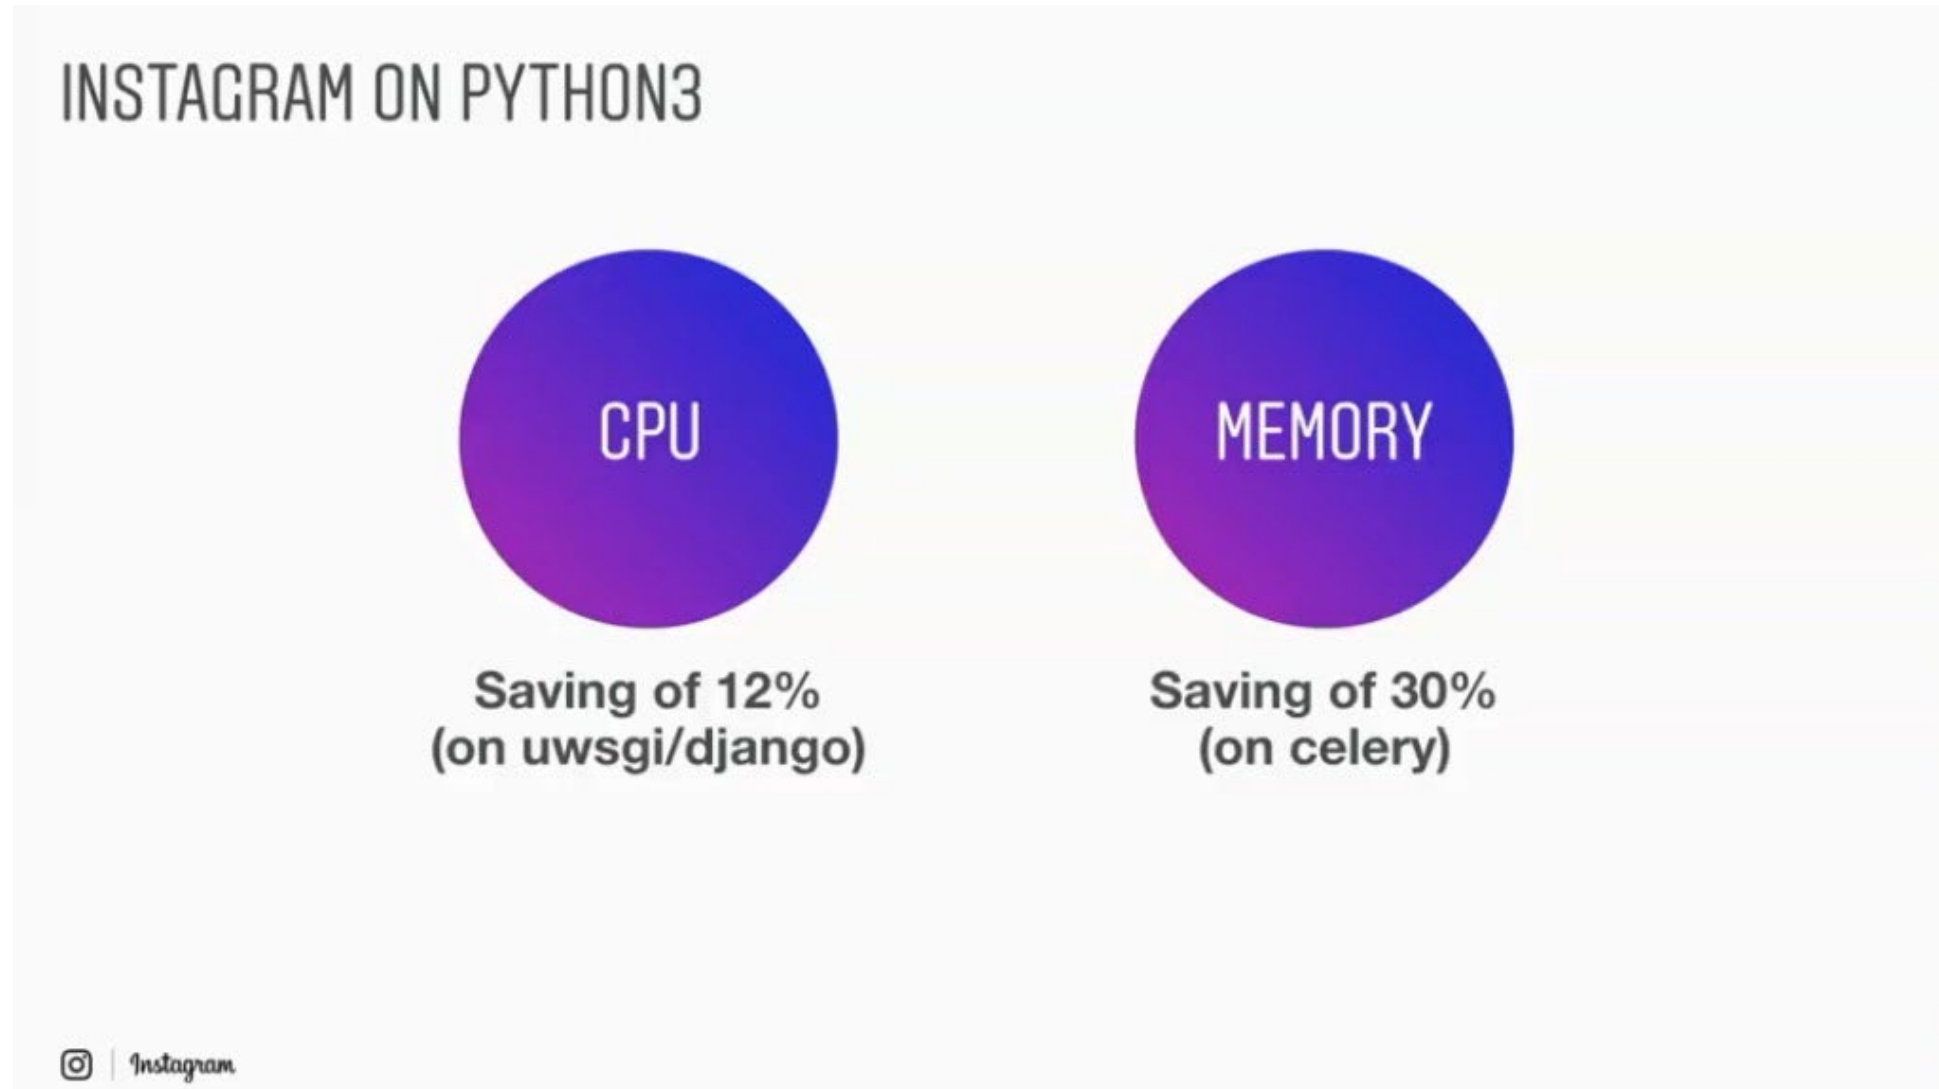

- Differences in unicode, str, bytes => add helper functions
- Differences in iterators, such as map => convert all maps to Py3 list
- Differences in dictionary order differences in the dumped JSON data  
=> force sorted\_keys in json.dump function

# Instagram's debt

---

Dropped Python 2 in Feb 2017

# Siri's debt

---

Voice assistants are “dumb as a rock,” Satya Nadella (Microsoft’s chief executive)

- Clunky Code: Weeks to update code
- One big snowball!
- 6 weeks to build db for adding 1 word

# Retire Technical Debt at Leisure

Set aside time to pay off technical debt:

- Google has (had?) “20%-time” for tasks such as this.

A new initiative can take on some technical debt:

- Refactoring at the start of a project.

Don't keep on putting off!

- When a crisis hits, it's too late
- Hasty fixes to unmaintainable code multiplies problems
- Eventually mounting technical debt can bury the team

# Now back to you...

## *Twilio Programmable Video v. Amazon Chime Video conferencing service*

- ◉ What if we need more than 50 people in a town?
- ◉ Discuss strategies for determining if/when/how to migrate to Chime

The screenshot displays the Twilio Programmable Video pricing page. At the top, the Twilio logo is on the left, and navigation links for Products, Solutions, Developers, Services & Support, and Pricing are on the right. The page features four vertical cards representing different service tiers. The 'Video Groups' card is highlighted with a 'Most popular' badge. Each card includes an icon, a title, a description, a starting price, a 'Start for free' or 'Talk to Sales' button, and a list of features.

Service	Starting Price	Participants	Key Features
Video WebRTC Go	\$0.00 for one-to-one video	Up to 2	Unlimited TURN relay, 2 days of Video Insights, Unlimited Datatracks
Video P2P	\$0.0015 per participant per minute	Up to 3	Unlimited TURN relay, Up to 10 audio-only participants, 7 days of Video Insights
Video Groups (Most popular)	\$0.004 per participant per minute	Up to 50	Noise Cancellation, Quality controls including Network Quality API
High Volume	Custom pricing and discounts	Dedicated account manager	Twilio Editions (Support for HIPAA Accounts, Encrypted recordings)

# Learning Goals

---

You should now be able to...

- Define *refactoring*, *technical debt*, and give examples.
- Explain how refactoring fits into agile process and help reduce technical debt
- Suggest when it may be appropriate to accrue technical debt and when it may be appropriate to retire it
